

# Control of Volunteer RR Canola..

- Just like with common ragweed – Size Matters!!!
- Canola control from UpBeet at 0.25 oz/A at cotyledon to 2-leaf canola and twice sequentially provided greater than 95% control
- Need to start herbicide applications before volunteer canola gets beyond the 2-leaf stage...
- Increasing the UpBeet rate to 0.5 oz/A and applying twice sequentially gave near complete canola control
